

/tadf I want to develop a system for my monthly invoice creation. As a freelancer, I track each project in a list containing the client, the date, and the specific line items or tasks I worked on. At the end of the month, I want to use an invoice template to automatically generate invoices based on the tracked entries for that month.

Message 2 · Assistant · 13:12

I'll route this task by task with TADF. First I need some context, and I've filled in what you already told me.

Question	Derived answer
SQ0: One task, several, or a whole system?	A whole system: tracking list in, finished invoices out. I need to split it into tasks first.
SQ1: What should it achieve?	Turn the month's tracked entries (client, date, line items) into one invoice per client using your template, without manual work.
SQ2: One-off or recurring?	Recurring, once a month.
SQ3: Proof of concept or production?	Open. Is this a trial for yourself, or will real invoices to clients depend on it from month one?

Proposed task list. Each task has one outcome that can be tested on its own. Only the first three are firm.

1. **Select and group entries.** [...]
2. **Prepare invoice content.** [...]
3. **Generate the invoice document.** [...]
4. **Deliver the invoice** (optional). [...]

Please confirm or correct these points:

- **SQ3:** Is this a proof of concept or production?
- **Task list:** Does the split fit, or should tasks be merged or separated?
- **Task 4:** Is sending the invoices in scope, or do you send them yourself?

It is a production system. The content is already grouped by client, so we can prepare the invoice content and generate the invoice document in one step. The document can then be saved in a folder for me to review before I send it manually.
