

1 • System context

Claude • message 2

SQ0 — Is this one task, several separate ones, or a whole system you want routed?

User • message 3

A whole system

Claude • message 4

SQ1 — What should the system achieve, and why is it being considered now?

User • message 5

The system should continuously monitor a Gmail inbox, identify new emails that require action, gather any context needed to respond, and create accurate, personalized draft replies for human review. It is being considered now because recurring inbox triage and first-draft preparation consume significant time, while the final decision to review and send each response should remain with the user.

Claude • message 6

SQ2 — Is this a one-off or recurring system, and roughly how often will it run?

SQ3 — Is this a proof of concept or a production system?

User • message 7

Recurring — continuous/near-real-time
Production

2 • Tasks and first gate decision

Claude • message 8

1. Triage — for each new inbox email, decide whether it requires a response/action [...]
2. Context gathering — for an email flagged as action-required, retrieve the information needed to respond [...]
3. Draft generation — compose a personalized reply draft from the gathered context, for human review.

User • message 9

Yes that sounds fine

Claude • message 10

Task 1 of 3: Triage

TQ0 — Describe this task in your own words.

What is the goal, and how would it run, step by step?

User • message 11

The task receives a normalized email record containing the message ID, thread ID, sender, recipients, subject, timestamp, body or snippet, and enough recent thread history to interpret the latest message. [...] Ambiguous cases should be marked for manual review rather than silently discarded. [...] `requires_action`: yes, no, or `manual_review`

Claude • message 12

No gate fires → this goes to the comparative route (workflow vs. agent scored against each other).
Does this gate block match your understanding, or would you correct any of these?

User • message 13

Yes, this gate block matches my understanding.
