

Verdict — Task 3a: Draft Composition

Build this as a workflow, using the canonical two-stage form: [...]

1. Gate record

No gate fired. [...] → Comparative route.

2. Fit and profile record

Criterion	Applies	Weight	Workflow cap.	Agent cap.	Workflow contrib.	Agent contrib.
P1 Traceability	Yes	3	3	2	9	6
P2 Safe failure	Yes	3	3	1	9	3
P3 Schema guarantee	Yes	3	3	2	9	6
P4 Efficiency	Yes	2	3	2	6	4
P5 Messy input	Yes	3	2	3	6	9
P6 Evolvability	Yes	2	1	3	2	6

M eligibility check: no M weights this time — nothing to check.

Totals: Workflow 41, Agent 34.

3. Design knowledge

01 — Implementation and execution environment.

This step touches no external systems (Gmail, docs, web) — it only consumes the already-assembled context package [...]

02 — Build form.

canonical two-stage form is the leading candidate: [...] Prototype this before committing.

03 — Build rules for this task.

Security guards: Fail closed — if the plan can't identify what to address or the context is insufficient to compose safely, return an explicit failure status rather than a best-effort draft with invented content.

04 — Model check.

Validate the concrete model specifically on informal, terse, or ambiguous-relationship threads before deployment, and on cases where the context is deliberately incomplete, to confirm it declines to invent facts rather than filling gaps plausibly.
