

Architect describes the system or the task in the chat (TQ0)

Assistant renders the window: one entry per task, proposed answers with reasons

Window rules applied in code on every click

Architect confirms or corrects each answer by click

G1 LLM necessity

fires

Deterministic code

The first gate that fires fixes the route. An open gate stops its task; other open answers take defaults.

TADF stops for this task; the approval rule still applies.

does not fire

G2 Task fit size

Decomposition

G2 splits by responsibility; G3 first offers a simplification, else it splits.

G3 Reliability boundary

The parts or the simplified task return to the assistant; a part that needs a third operation gets no route.

G4 Adaptive control flow

Agent

No totals; the weights set the controls. G5 adds a stopping criterion and a list of the consulted sources.

G5 Open retrieval

no gate fires

Comparative assessment

LLM workflow or agent

M check first; the higher weighted total wins; a tie goes to the LLM workflow.

send result

Assistant recomputes each task from the rulebook and replies in about 150 words per task
